Analyze Factors Influencing Credit risk and classify customers.

*Objective.

The objective is to identify factors affecting Credit risk and classify customers into low, medium, and high-risk catogories.

*Dataset description:

The dataset contains customer details such as income, age, loan amount, credit history, and repayment status. these details help analyse customer credit risk.

*Approach and techniques used.

Python, pandas, and Numpy are used for data clearing and analyses. Statistical analyses and data Visualization help identify important risk factors and classify customers.

*key Findings and Insights:-

customers with stable income and good credit history generally have lowes risk. customers with high debt and poor repayment history may have higher risk.

*Conclusion:

Credit risk analysis helps banks identify risky customers, reduce financial losses, and make better loan approval decisions.
